

# Find Your Right Glove Size

Use this chart to check your hand size

Everyone's hands are different. This ESKO size guide combines two measurements – width of palm and finger length – to help find the best size for your unique hands.

Print a copy of this chart, check that the scale line has printed correctly at 130mm.

Place a pen or pencil on the X; line your hand up so that the fingers extend straight out and the left of your index finger lines up as closely as possible to the dashed line. Slide the joint of your thumb and index finger up to the pen placed over the X.

Then check to see which line comes closest to (a) the right-hand edge of your hand across the knuckles and (b) to the tip of your middle (longest) finger.

Align index finger

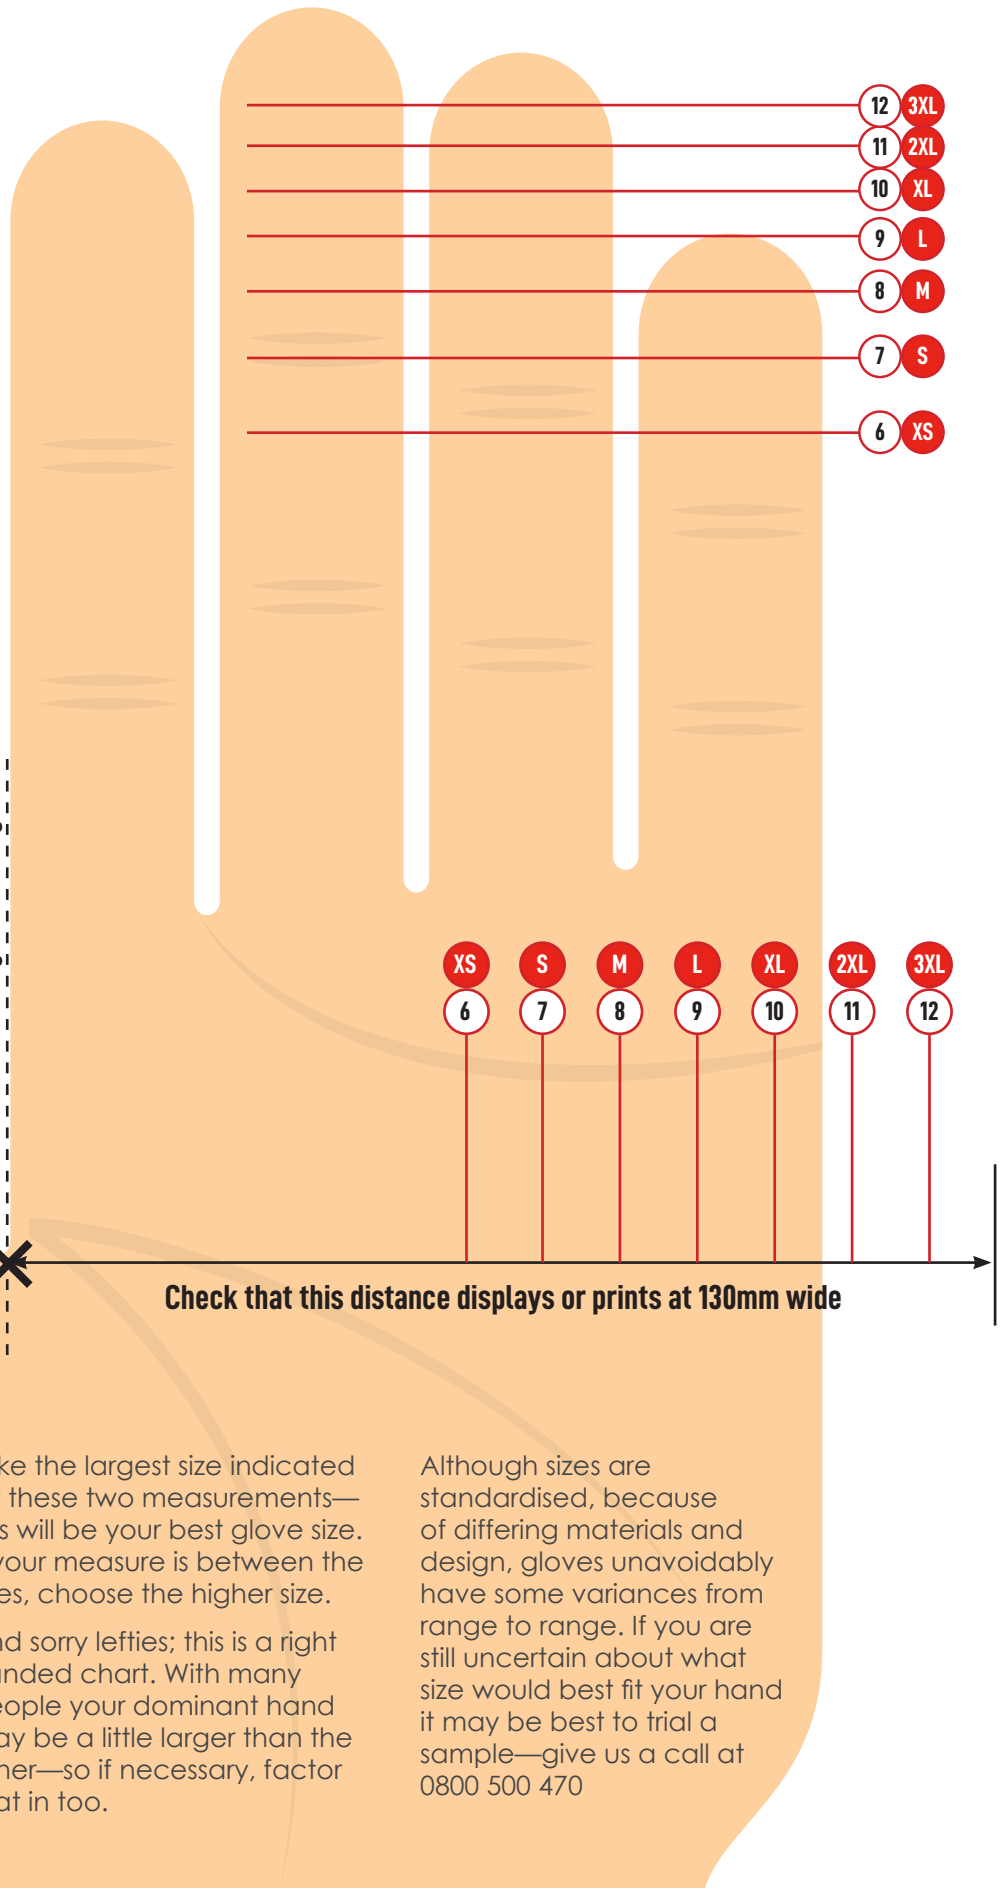

Check that this distance displays or prints at 130mm wide

Take the largest size indicated by these two measurements—this will be your best glove size. If your measure is between the lines, choose the higher size.

And sorry lefties; this is a right handed chart. With many people your dominant hand may be a little larger than the other—so if necessary, factor that in too.

Although sizes are standardised, because of differing materials and design, gloves unavoidably have some variances from range to range. If you are still uncertain about what size would best fit your hand it may be best to trial a sample—give us a call at 0800 500 470
